Supplements to the guidelines on certain State aid measures in the context of the system for greenhouse gas emission allowance trading post-2021

The guidelines on certain State aid measures in the context of the system for greenhouse gas emission allowance trading post-2021 (1) are supplemented as follows:

- (1) in point 15, number 15, the figure '80' is inserted in the place of the indication '[...]', and two paragraphs are added, so as for the current wording of that definition to read as follows:
  - '(15) 'fall back electricity consumption efficiency benchmark' means 80 per cent of actual electricity consumption, determined by ESA decision together with the electricity consumption efficiency benchmarks. It corresponds to the average reduction effort imposed by the application of the electricity consumption efficiency benchmarks (benchmark electricity consumption/average electricity consumption). It is applied for all products which fall within the eligible sectors, but for which an electricity consumption efficiency benchmark is not defined.

The fall back electricity consumption efficiency benchmark shall be reduced (as from year t = 2022) by 1.09% on an annual basis, according to the formula established in Annex II under 'Updated efficiency benchmarks for certain products referred to in Annex I'.'

- (2) in point 28, point (b), the description of the factor Ct used in the formula is supplemented, so as for the current wording of that point to read as follows:
- '(b) Where electricity consumption efficiency benchmarks listed in Annex II are not applicable to the products manufactured by the beneficiary, the maximum aid payable per installation for costs incurred in year t equals:

$$Amaxt = Ai \times Ct \times Pt-1 \times EF \times AECt$$

In this formula, Ai is the aid intensity, expressed as a fraction (e.g. 0,75); Ct is the applicable CO2 emission factor or market-based CO2 emission factor (tCO2/MWh) (at year t); Pt-1 is the EUA forward price at year t-1 (EUR/tCO2); EF is the fall-back electricity consumption efficiency benchmark as defined in point 15 number 15.; and AEC is the actual electricity consumption (MWh) in year t.'

- (3) in the table in Annex I, the description of the sector covered by the NACE code 20.16.40.15 is completed/supplemented, so as for the current wording of that description to read as follows:
- 'Polyethylene glycols and other polyether alcohols, in primary forms'
- (4) the following Annex II is inserted:

<sup>(1)</sup> OJ L 130, 15.4.2021, p. 3, and EEA Supplement No 27, 15.4.2021, p. 3.

## 'Annex II - Electricity consumption efficiency benchmarks and annual reduction rates for products referred to in Annex I

- Electricity consumption efficiency benchmarks for products referred to in Annex I with exchangeability of fuel and electricity: Products for which exchangeability of fuel and electricity was established in Section 2 of Annex I to Delegated Regulation (EU) 2019/331.

Delegated Regulation (EU) 2019/331 in Annex I established that in respect of certain products there is substitutability between fuel and electricity. For those products, it is not appropriate to set a benchmark on the basis of MWh/t of product. Instead, starting points are the specific greenhouse gases emission curves derived for the direct emissions. For those products, the product benchmarks were determined on the basis of the sum of direct emissions (from energy and process emissions), as well as indirect emissions arising from the use of the inter-exchangeable part of the electricity.

In those cases, factor 'E' in the formula for the calculation of the maximum aid as referred to in point 28(a) of these Guidelines is to be replaced by the following term that converts a product benchmark laid down in Delegated Regulation (EU) 2019/331 into an electricity consumption efficiency benchmark on the basis of an average European CO2 emission factor of 0,376 tCO2/MWh:

Existing product benchmark from Annex section 2 from Regulation  $2021/447^2$  (in tCO2/t) × share of relevant indirect emissions over the baseline period (%)/0,376 (tCO2/MWh).

The value of the efficiency benchmarks for products with exchangeability of fuel and electricity to be applied in the period 2021 – 2025 can be found in the Regulation (EU) 2021/447 of 12 March 2021 determining revised benchmark values for free allocation of emission allowances for the period 2021 to 2025 pursuant to Article 10a(2) of Directive 2003/87/EC of the European Parliament and of the Council.

## - Efficiency benchmarks for products referred to in Annex I that are not listed in Table 1 of this Annex

The fall back electricity consumption efficiency benchmark as defined in point 15 number 15 of these Guidelines is applicable for all eligible products referred to in Annex I for which an electricity consumption efficiency benchmark is not defined.

## - Updated efficiency benchmarks for certain products referred to in Annex I

Table 1 lists the benchmark values that should be used as a starting point for the determination of the applicable efficiency benchmark for a specific year, taking into account the corresponding annual reduction rate.

<sup>&</sup>lt;sup>2</sup> Commission Implementing Regulation (EU) 2021/447 of 12 March 2021 determining revised benchmark values for free allocation of emission allowances for the period from 2021 to 2025 pursuant to Article 10a(2) of Directive 2003/87/EC of the European Parliament and of the Council (OJ L 87, 15.3.2021, p. 29–34). Regulation 2021/447 is incorporated into the EEA Agreement at point 21alo of Annex XX by EEA Joint Committee Decision No 221/2021 (not yet published).

That annual reduction rate describes by how much the benchmarks will be automatically reduced annually. Unless stated otherwise in Table 1, all efficiency benchmarks (including the 'fall back electricity consumption efficiency benchmark') shall be reduced (as from year t = 2022) by 1.09% on an annual basis, according to the following formula:

efficiency benchmark applicable in (year t) = benchmark value in 2021 \*  $(1 + annual\ reduction\ rate)^{(year\ t-2021)}$ 

Table 1: Electricity consumption efficiency benchmarks for certain products referred to in Annex I
